

Repsol introduces new line of blue-color fuels in its service stations

Repsol said in late February it has introduced a new line of fuels, identified by a blue color, in its service stations and that the products are improved with a formula named Neotech which it said can extend the vehicle's engine life among other qualities.

Repsol described the product as its “third generation formula” adding it can help control emissions and won’t increase price.

“The composition of these new fuels developed by the scientists and researchers at the Repsol Technology Centre guarantees the highest quality as it uses exclusive tracers that prevent fraud and assure the customer of the origin, purity and authenticity of the product,” the company said.

The new Neotech line is available in diesel (Diesel e+ and Diesel 10 e+) and petrol (Efitec 95 and Efitec 98). They will be identifiable by their blue color that guarantees their authenticity, Repsol said.
