

Berrys EROS reaches milestone in Malaysia

Berrys Technologies has reached a milestone with its EROS (Easy Riser) Vent system with the 3,000th unit having recently been sold into Malaysia.

The EROS was brought to the UK market in 2004 and since its inception has been specified by 95% of the UK market.

The EROS system allows the vent pipe for fuel storage tanks to be hinged and the vent pipe brought down to a height on the forecourt where the maintenance operative can easily inspect or change the pressure vacuum valve without the need to work at height. The EROS system has been hailed by the HSE (Health & Safety Executive) as a major contributor to decreased incidents of injury associated with working at height. From an operations perspective the EROS can be operated by the nominated maintenance company or even site personnel if required.

The costs and time normally associated with the annual inspection of the pressure vacuum (PV) valve are completely eliminated, thereby ensuring a quick return of investment in year one. The EROS is offered in three variants, 2", 3" and the "cranked" (off set) design, which allows installation close to a

boundary or building but “cranks” the vent and PV valve away from the boundary and back into the forecourt zone.

The EROS is used globally by various oil companies and supermarket groups as well as being on the Shell Global Design Specification as standard equipment for both new builds and existing sites. EROS has been installed in a number of countries across Europe, the Middle East and Asia and in Australia and South Africa with constant interest from new territories almost on a daily basis.
