

UK: BP to tap Gilbarco's cloud-based solution

Oil company BP will adopt Gilbarco Veeder-Root's Insite360 at all BP-owned gas stations in the United Kingdom early next year, according to a company release. Under the same agreement, BP will offer Insite360 to all its UK dealers as part of the standard fuel contract agreement.

Insite360, an advanced cloud-based system used for effective wetstock management, provides monitoring capability through real-time analysis, sudden loss detection, and 24/7 alarm management. It also offers highly-precise AccuChart™ tank calibration, meter drift detection, and delivery reconciliation.

Another functionality is the new Price/Margin Management module, which aims to increase fuel retail margins and provide up-to-date competitor price information.

It also offers Inventory Planning, which helps in automated fuel orders creation, and Inventory Forecasting, which has various functionalities such as Delivery, Plan Analysis, Retain, and Run-out Forecasting.

The program can be accessed on most mobile services and technical support is available 24/7.

"We are delighted to partner with BP UK and bring our vast know-how in wetstock management to improve its forecourt operations. This milestone illustrates the solid growth Insite360 is seeing across Europe, where we expect other important partnerships to be forged next year," comments Patrick Forsythe, WSM Managing Director at Gilbarco Veeder-Root.

Gilbarco Veeder-Root is a technology solutions company specializing in retail and commercial fueling operations.
