

TATSUNO's LNG Projects

Liquefied natural gas vehicles, which enjoy a much better filling speed and distance-to-empty than CNG vehicles, are starting to become popular in USA and China. Responding to these market needs, TATSUNO started developing LNG dispensers.

In 2015, TATSUNO completed the LNG dispenser and Coriolis mass flowmeter. The first LNG dispenser in Japan was installed this year and is operating perfectly.

The same model of LNG dispenser and Coriolis mass flowmeter for LNG is displayed in the showroom of TATSUNO Yokohama Plant. These and other environmentally friendly products of ours are attracting many visitors.

The Natural Gas International Exhibition was held in Beijing, China in May of 2015, 2016. TATSUNO displayed them with Coriolis mass flowmeter for hydrogen dispenser to show its high accuracy and quality, and to introduce our environmental conservation projects.
