

Trassa is further expanding the petrol station network with Scheidt & Bachmann systems

The Russian Trassa Group has once again chosen Scheidt & Bachmann's petrol station management systems, continuing the long-term partnership with Scheidt & Bachmann.

Trassa Group is expanding its petrol station network with a further 40 filling stations and will equip them with the current system generation, thereby future-proofing its platforms.

Using current hardware and software based on Windows 10, the TMS 30 systems are prepared for expansion in the future with the innovative SIQMA cloud solutions. Especially for the Russian market, the petrol station management system has been supplemented by various functions so that all requirements for modern petrol station management are met. The petrol stations are managed using the Scheidt & Bachmann head office system, NMS, which enables the central management of all petrol stations from the Trassa company headquarters. In addition to centralised wet stock management, the system also enables centralised article management and settlement as well as interfacing to the company's own accounting systems. This year, Scheidt & Bachmann will be servicing almost 100 Trassa petrol stations in the Greater Moscow area.
