

UK: Box Energi plans to install 2,500 EV fast chargers

The company plans to set up 2,500 locations by 2025, with at least 100 chargers expected to be operational by January 2020.

The shop network will operate under the name Drive Energi. The contract to supply the charging stations has also already been awarded: The Australian supplier Tritium is to supply at least 2,500 of its Veefil-RT DC chargers with a charging capacity of 50 kW. In addition, Tritium will provide maintenance and service for the chargers.

Tritium has been chosen because it is “reliable, robust and trustworthy”, said James Moat, CEO of Drive Energi. “These chargers are not only the fastest and most advanced in their class, but incredibly easy to use and, with the world’s smallest physical footprint, to deploy as well – particularly in our cities and high-density areas where space is increasingly limited.”

Two 50kW chargers will be installed at each location, according to a press release. When the expansion is completed in 2025, Drive Energi claims to be the world’s largest DC fast charging

network in any country. With the targeted density of fast chargers, the company wants to eliminate EV range anxiety in Great Britain.

However, not all stations will be open to the public. Drive Energi is targeting an unspecified mix of public and private charging stations. The private charging stations are to be installed at companies and help to electrify vehicle fleets.
