

Spain: IONITY opens first ultra-fast charger with Cepsa

In July 2018, Cepsa signed a collaboration agreement with IONITY for the installation of electric charging points at its service stations in Spain and Portugal.

In conjunction with Cepsa, IONITY has launched its first high-power charging station in Spain. Located in Pallejà (Barcelona), the new site is equipped with 4 high power charging points each with a capacity of 350 kW.

Offering 1,2 Mega Watt of power for the 4 high power chargers, the IONITY station is among the fastest in Spain. IONITY has prepared the station for 2 additional high-power chargers that can be added depending on the demand. Cepsa will supply 100% renewable energy to these facilities.

This first station in Spain is the latest chapter in the expansion of IONITY's pan-European charging network. The objective is to make long distance EV travel a reality. Pallejà is also one of 340 ultra-fast charging stations being deployed within the Europe-E project, covering main routes across 13 EU Member States and along all 9 TEN-T Core Network Corridors and the Core Network. The EUROPE-E

project is co-financed by the Connecting Europe Facility of the European Union.

In July 2018, Cepsa signed a collaboration agreement with IONITY, the European high-performance charging network formed by the BMW Group, Daimler AG, Ford Motor Company, and the Volkswagen Group with Porsche AG, for the installation of electric charging points at its service stations in Spain and Portugal.
