

## Neste opens Finland's first low-emission service station

**A service station of the future with over 30% smaller carbon footprint.**

Neste opens Finland's first low-emission service station in the Tuusula Housing Fair 2020 area. Climate-friendly solutions have been used in the construction, operations and product range of the station.

The station features a Neste Easy Deli self-service store, OmaPosti kiosk, Neste MY Renewable Diesel and fast charging for electric vehicles. In early autumn, biogas and natural gas filling points will also be opened at the station.

"At Neste's future service station, motorists can significantly reduce their carbon footprint with Neste MY Renewable Diesel. In addition, it is great that our station also offers climate-friendly alternatives for electric and gas car owners. The combined use of renewable diesel, biogas and electricity will reduce greenhouse gas emissions by more than 80% per year compared to average refueling products," says Katri Taskinen, Vice President for station network in Finland, Marketing & Services, Neste.

The first gas filling station in central Uusimaa will also be opened at Neste's service station, offering both biogas and natural gas for passenger cars and delivery vehicles.

"We make it possible to fill up with fully renewable and Finnish biogas at Rykmentinpuisto. This is our company's first gas filling station, and it is great to present it as part of Neste's service station of the future," says Mika Paloranta, Managing Director, Suomen Kaasuenergia Oy.

The future service station will also include a Posti OmaPosti kiosk, where packages and registered letters can be collected, returned and sent to Finland and abroad daily. The service point complements South Tuusula's postal services, bringing online purchases close to residents of the area and others passing through. Personal video chat support is also available when necessary.
