

ASIS Automation invested heavily in R&D and created COVID19 related Safety Systems

ASIS continues to make a difference with its advanced R&D Team. ASIS Innovation Committee came up with an idea to create hygiene products to have another approach to its vision and products. After doing some research committed to creating hygiene products needed for most business partners, ASIS consolidated the importance of its employees and human health.

One of the new products is Thermogate®, Infrared Body Temperature Detection System. It is a 32-point precision IR thermometer designed for measuring the temperature of the human body and screening people who have a fever.

In epidemic diseases such as coronavirus, the determination of body temperature is an important indicator of the virus where the density of personnel is high. The human fever measurement devices used in the market cause serious time loss in single measurements and ineffective controls are carried out. ASIS has developed Thermogate® product for the concept of providing psychological support for people entering the indoor area and prestige to your company.
