

American Natural Gas completes extensive upgrades to 18 CNG sites

American Natural Gas has carried out the comprehensive modernization of 18 recently-acquired compressed natural gas (CNG) fuelling stations across the Midwest, Southwest, and West Coast.

American Natural Gas (ANG), a premier distributor of alternative motor fuels and an operating subsidiary of HC2 Holdings, has completed the revamp of 18 CNG fuelling stations.

The extensive upgrades included rebuilt compressors to improve reliability and add remote access controls and 24-hour surveillance systems; new Bennett Crind dispensers at seven of the locations with NGV1 and NGV2 nozzles; upgraded IT systems to support remote monitoring; and upgraded POS systems for a seamless customer experience.

"CNG is the best choice for those in the transportation industry that want to adopt a reliable, ultra-clean-burning technology. And with exciting changes on the horizon such as renewable natural gas with a 115% reduction in overall emissions and the new Cummins Westport zero emissions CNG engines, we're seeing demand dramatically increase," Drew West, Chief Executive Officer of ANG.

In tandem with the station upgrades, ANG also unveiled a new corporate website, www.AmericanNaturalGas.com, which features an interactive Station Locator Map.
