

Fuel management provider partners with Amazon Web Services

Environmental Monitoring Solutions Pty Ltd (EMS) has accepted a partnership with Amazon Web Services (AWS) as an Independent Software Vendor.

Fuelsuite, the cloud-based fuel management innovation by EMS, was built on a range of AWS technologies. The solution allows users to access remote fuel site data in real-time.

The support of AWS has allowed for rapid deployment and scalability of Fuelsuite from virtually anywhere in the world. Since its release in September 2017, EMS has connected 1,070 retail petrol stations with Fuelsuite's enabling IoT device Fuelscan across the globe, according to a company release.

"The AWS partnership will support EMS's accelerated growth as they continue to improve enterprise fuel management within the retail petroleum industry. By leveraging AWS's global footprint, EMS will have supported entry into China, India and other international markets," writes EMS.

EMS recently presented Fuelsuite at the AWS Summit in Sydney, and has received an invitation to present Fuelsuite to the Institute of Engineers Australia.
