

Shell to roll out hydrogen filling stations in the Netherlands

Shell aims to establish a network of hydrogen filling stations in the Netherlands and expects to roll out four stations by 2020—two in Amsterdam, one in The Hague, and one in Pesse.

The oil giant wants to play an active role in the Dutch energy transition and is also working on establishing a network of fast charging stations for electric vehicles, reports [Gasworld](#).

To roll out the hydrogen stations, Shell is availing of a government scheme called the Demonstration Regulation for Climate Technologies and Innovations in Transport (DKTI Transport) of the Netherlands Enterprise Agency, which offers subsidies to low emission transport solutions.

In addition, Shell's hydrogen stations are part of the extensive hydrogen project H2Benelux, a project co-financed by the 'Connecting Europe Facility' of the European Union.
