

SECON-X: 24/7 live monitoring of gas stations without sharing the sensible data out of your office

“Cloud technologies”, “peer-to-peer”, “software as a service”... these terms are known by any professional in the market nowadays. However, the technological development brings not only the ease of processes and new level of automation but also significant risks that are usually a challenge to petrol station owners: data transmission security, data storage on 3rd party infrastructure, account thefts. These risks can lead to data leakage and big losses for the business in general as a result.

In such specific conditions there is a need for a balanced solution with a high level of security from one hand that can work in the IT infrastructure of the company without sharing the sensible data outside from another hand.

And we are happy to announce that such solution exists! **FAFNIR GmbH** found the balance between the security and risk optimization in **SECON-X**.

SECON-X is the universal data collection visual platform for the fuelling stations with the option of

remote access via web interface, that can be reached from any device: PC, tablet computer or smartphone.

The system provides all data that is stored in the ATG system, including oil separator level (COMS), vapour recovery system information (VAPORIX) and a lot more. The system can be installed on the companies' IT servers and can work without 3rd party "cloud".

On top of that **SECON-X** has the following features:

- friendly multilingual graphic user interface;
- wide possibility to integrate with ERP systems;
- useful remote diagnostic functions;
- secured VPN network connection and access rights;
- ... and much more!

Visit the [website](#) and [contact](#) to learn more how **FAFNIR** solutions can help your business."
