

Petrol PLAZA

Blue1

Blue1 is established in 2006 and specialized in the engineering and construction of AdBlue solutions and telemetric applications.

Due to the fast growing and dynamic AdBlue market, we are continuously evaluating and (re)engineering our products to definitely deliver high quality and innovative solutions which are adapted to the needs of our customers.

Besides a complete range of industrial products (not MID or weight and measurements approved), Blue1 can offer you also a full range of commercial AdBlue applications which can be connected to all MID approved dispensing systems. For both types of applications we have a wide variety of standard off the shelf solutions but we are also able to offer you completely tailor-made applications or project related solutions from first to last which are adapted to the environmental conditions of the location.

Through our partner and distributor network we are not only able to provide, service and maintain solutions within Europe but all over the globe.

Measuring and monitoring in real time is an essential tool in a world of short global communication lines. Therefore Blue1 has also developed a complete telemetry system which covers hardware, communication and visualization in function of our customers needs. The SpoTTbox system enables you to optimize your production, your distribution and your stock levels to ensure continuity and cost efficiency. The system is based on M2M communication which is eliminating the distances of our global economy.

Equipment & services

- DEF & AdBlue Equipment
- Depot & Storage Equipment
- Environmental Protection Systems
- Pumps, Dispensers & Components
